PROTECTION SYSTEMS

Taking a tailored approach to supporting your new, old & obsolete machine protection systems

WHAT WE DO

We work with you to determine the most appropriate system hardware, software configuration and connectivity - maintaining existing or replacing with modern equivalents as appropriate.

SUPPORTING AGEING, OBSOLETE & NEW SYSTEMS

We have a wealth of knowledge and experience supporting obsolete/legacy and modern protection systems alike, including OEM packaged systems.

ROBUST, METHODOICAL & PRAGMATIC APPROACH

A team of skilled & experienced engineers will take the time to get to know your specific application, needs and objectives.

We work with you to develop & implement robust, targeted strategy to improve & maintain your equipment for the remainder of its service life.

We understand the role API670 and IEC protection systems play in maintaining system safety and integrity, ensuring that your equipment and operating regime remain fully compliant.

PREVENTATIVE & REACTIVE MAINTENANCE

We provide a comprehensive suite of preventative maintenance services focused on increasing reliability & extending service life.

When reactive maintenance is required, we minimise downtime to return your systems to service as quickly as possible.

Our local 24/7/365 base of operations and extensive stock of service parts allows us to mobilise people & equipment at short notice.

TARGETED UPGRADES

We can provide fully engineered upgrades, designed built & tested at our local facilities.

We focus on developing solutions that provide the desired level of performance & reliability while minimising downtime, risk, and disruption.

We ensure all systems will satisfy your compliance requirements (LOPA, SIL assessments etc) in compliance with IEC and API standard requirements.

We specialise in providing data acquisition upgrades that allow online performance and operating information to be collected and transferred for data analytics purposes.
